Lesson 3

Objective: Draw and label a bar graph to represent data; relate the count scale to the number line.

Suggested Lesson Structure

- Fluency Practice (12 minutes)
- Application Problem (5 minutes)
- Concept Development (35 minutes)
- Student Debrief (8 minutes)
- Total Time (60 minutes)

Fluency Practice (12 minutes)

- Sprint: Addition and Subtraction by 5 2.NBT.2 (9 minutes)
- Coin Drop 2.NBT.2, 2.OA.2 (3 minutes)

Sprint: Addition and Subtraction by 5 (9 minutes)

Materials: (S) Addition and Subtraction by 5 Sprint

Note: This Sprint gives practice adding and subtracting by 5 in preparation for counting nickels in Topic B.

Coin Drop (3 minutes)

Materials: (T) 10 dimes, 5 nickels, can

Note: In this activity, students practice adding and subtracting fives and tens.

T: (Hold up a nickel.) Name my coin.
S: A nickel.
T: How much is it worth?
S: 5 cents.
T: Listen carefully as I drop coins in my can. Count along in your minds.

Drop in some nickels, and ask how much money is in the can. Take out some of the nickels, and show them. Ask how much money is still in the can. Continue adding and subtracting nickels for a minute or so. Then, repeat the activity with dimes and nickels.
Application Problem (5 minutes)

Materials: (T) Tally chart (S) 1 Number of Books Read picture graphs (Template 1) per student

a. Use the tally chart to fill in the picture graph.

<table>
<thead>
<tr>
<th>Number of Books Read</th>
<th>Jose</th>
<th>Laura</th>
<th>Linda</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>III</td>
<td>III</td>
<td>III</td>
</tr>
</tbody>
</table>

b. Draw a tape diagram to show how many more books Jose read than Laura.

c. If Jose, Laura, and Linda read 21 books altogether, how many books did Linda read?

d. Complete the tally chart and the graph.

Note: This problem reviews creating and interpreting picture graphs. It also anticipates one element of the Concept Development in which students relate the bars of a graph to the bars of a tape diagram. Prior to the lesson, cut apart Template 1 so that each student receives one graph.

Concept Development (35 minutes)

Materials: (T) Horizontal and vertical bar graphs (Template 2), Chart 3: Animal Classification and Chart 4: Animal Habitats (from Lesson 1), completed Template 1 (from Lesson 2) (S) Tape diagrams from Application Problem, horizontal and vertical bar graphs (Template 2), personal white board, paper or math journal
Lesson 3:

T: Take your Application Problem, and turn it sideways like mine. (Model as students do the same.)

T: Talk with your partner: What do you notice about the picture graph when it’s turned this way?

S: Hey! It looks just like a tape diagram! The bars on the tape diagram show the same amount as the circles on the graph. They both show that 8 is longer than 5. They both show the difference between 8 and 5, but you can count the three empty spaces on the graph.

T: (Display the completed vertical picture graph [Lesson 2 Template 1], pictured below to the right.)

T: Talk with your partner: How can you tell by looking at the graph which category has more and which has less?

S: The category with the most is the tallest, and the category with the least is the shortest.

T: Do the data change if I turn the graph sideways? (Rotate the graph to the horizontal position.)

S: No!

T: True! So, we’re learning some interesting things about graphs. We can change the position of the graph from vertical to horizontal, and the data stay the same.

T: (Display Chart 3: Animal Classification from Lesson 1.) And we learned we can show the same data in a table and in a picture graph.

T: Well, guess what? We can also show the information another way!

NOTES ON MULTIPLE MEANS OF ACTION AND EXPRESSION:
The language of comparison can be challenging for English language learners. Allow them to choose the language they prefer for discourse. Also, accompany comparative language such as more, less, taller, and shorter, with illustrative gestures.

Project or draw the horizontal bar graph from Template 2. Then, pass out student copies of the template, and have students slide the sheet into their personal white boards.

T: We’re going to create a bar graph to show the data from our Animal Classification table.

T: For our graph to make sense to someone who’s reading it, it needs to have a title. What is the title of our chart?

S: Animal Classification!

T: We’re showing the same information, just in a different way, so the title stays the same. Fill in the title while I do the same. (Record the title as students do the same.)

Template 1 from Lesson 2

Chart 3 from Lesson 1

Template 2
Lesson 3: Draw and label a bar graph to represent data; relate the count scale to the number line.

T: How many categories of animals did we classify?
S: Four!

T: Let’s label those same categories in the same order on the bar graph. (Record as students do the same.)

T: How did we record the number of animals on the table?
S: We used tally marks.

T: And how did we represent the number of each animal on the picture graph?
S: We drew a picture to represent each animal.

T: Watch how we represent data on a bar graph. (Fill in the scale.)

T: (Point to the numbers.) First, I fill in the scale. What are we counting by?
S: Ones!

T: Yes. Whisper to your partner what the scale reminds you of.
S: It’s like a meter strip. → It’s like the numbers on a ruler. → It’s a number line!

T: The scale tells us that each box equals one, so how many boxes should we color in for the bird category?
S: Four boxes!

T: Color four boxes in the bird row. (Model as students do the same. Continue in this way to complete the graph.)

T: Now, just as with the picture graph, we can use the bar graph to ask and answer questions.

Pose questions such as those below, and have students write their answers on paper or in a math journal. Then, invite students to pose questions to the class based on the picture graph. Invite students to utilize the compare question sentence frames from Lesson 2 as needed.

- How many more mammals than reptiles are there?
- How many fewer birds than reptiles are there?
- How would the graph change if we added four more birds to the bird category?

Repeat the process to create a bar graph of the data from the Animal Habitats table using the second graph (vertical orientation) on Template 2.

After creating the graph, invite partners to ask and answer questions based on the data.
Lesson 3

Lesson 3: Draw and label a bar graph to represent data; relate the count scale to the number line.

As students demonstrate proficiency creating and interpreting the graph, allow them to move on to the Problem Set. Continue working with any students who need support.

Problem Set (8 minutes)

Students should do their personal best to complete the Problem Set within the allotted 10 minutes. For some classes, it may be appropriate to modify the assignment by specifying which problems they work on first. Some problems do not specify a method for solving. Students should solve these problems using the RDW approach used for Application Problems.

Student Debrief (8 minutes)

Lesson Objective: Draw and label a bar graph to represent data; relate the count scale to the number line.

The Student Debrief is intended to invite reflection and active processing of the total lesson experience.

Invite students to review their solutions for the Problem Set. They should check work by comparing answers with a partner before going over answers as a class. Look for misconceptions or misunderstandings that can be addressed in the Debrief. Guide students in a conversation to debrief the Problem Set and process the lesson.

Any combination of the questions below may be used to lead the discussion.

- Look at the first graph in your Problem Set. What did you write on this graph that we didn’t put on our graph yesterday? How do the numbers on the bottom help us to record data in a bar graph?
- Show your partner which part of your graph shows how many more birds than reptiles there are.
- Look at your neighbor’s habitat graph. Are the numbers on the scale written horizontally or vertically?
When you were coloring the boxes to record how many animal habitats are in the grasslands, did you count each box, or did you look at the numbers you wrote? Which strategy would be faster?

Why are bar graphs good for making comparisons? Can you tell which category has more or less without using the scale? How does the scale help you make more precise comparisons?

How does writing numbers on our graphs help us to use tape diagrams? How do bar and picture graphs help us to draw tape diagrams so that we can see the difference (more than or fewer than) between groups?

Tell your partner the different types of graphs you know how to use. What are the differences and similarities between them? Do they all use numbers?

Exit Ticket (3 minutes)

After the Student Debrief, instruct students to complete the Exit Ticket. A review of their work will help with assessing students’ understanding of the concepts that were presented in today’s lesson and planning more effectively for future lessons. The questions may be read aloud to the students.
### Addition and Subtraction by 5
